RoomCheck

RoomCheck handover report

Room	Room 4B
Scan	03 Nov 2026, 13:23 (UTC+08:00) to 03 Nov 2026, 13:24 (UTC+08:00)
Report made	03 Nov 2026, 13:25 (UTC+08:00)
Type of check	With permission
Network checked	192.0.2.0/24 (Wi-Fi "Example-Home")
Where I'm staying	Short stay

For the host or platform

> On 03 Nov 2026 I checked the devices and Wi-Fi in Room 4B, where I'm staying, using RoomCheck on my own laptop. I had permission to ask the devices on the network which services they offer. I also looked around the room in person on 03 Nov 2026. I'm asking you about 3 things, listed below with when I asked and what has happened since.

What I'm asking, and its status

Task	Who to ask	Status	Changed
Look at this first: Ask about the device that looks like a camera	Host	To do	Not changed yet
Look at this soon: Ask about the router letting devices open internet ports	Host	To do	Not changed yet
Look at this soon: Ask for WPS to be turned off on the router	Host	Asked	04 Nov 2026, 17:30 (UTC+08:00)
Look at this soon: Check the item tracker nearby	You	To do	Not changed yet

Physical check

Done on 03 Nov 2026. 3 of 8 places looked at.

Smoke detector · USB chargers and power adapters · Mirrors

1 note left out (notes weren't included in this report).

Findings in detail

Needs attention. 5 things to look at: Watching 2 · Control 0 · Wi-Fi 3

Likely camera: it offers a live video stream, the kind security cameras use.

Device types are unconfirmed: clues, not proof.

Is anything watching?

2 things to look at

Likely camera · ⓘ Look at this first

About: Camera, address xx:xx:xx:00:53:58 (ICANN, IANA Department), at 192.0.2.58

What we observed:

- It answers camera discovery requests (ONVIF).
- It offers a live video stream, the kind security cameras use.
- It has a port open that camera recorders often use (port 8000).
- It calls itself “cam-hallway”.

What it could mean: If it is a camera where you stay, it could record you, and someone could watch what it records.

A device on this network may be a camera. A camera could record you. You have a right to know where it is.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: Find it physically, then say where it is. Many platforms don't allow indoor cameras.

- Don't touch or unplug it. Photograph it where it is.
- Leave if you feel unsafe.
- Report it to the platform and the police.
- Laws differ by country. This isn't legal advice.

Why we think this: identification confidence Likely · priority: Look at this first

- Looks like a camera: Likely
- Answered a camera discovery request (ONVIF video transmitter)
- Runs a video-streaming server (RTSP) (port 554)
- Has a port open that camera recorders often use (port 8000)
- Its name or model mentions a camera (cam-hallway)
- Maker: Example Camera Co.
- Network address: 192.0.2.58
- Open services on ports: 80, 554, 8000

Also found (For information. Not counted as things to look at.)

Known issues reported for this model · ⓘ For information

About: Camera, address xx:xx:xx:00:53:58 (ICANN, IANA Department), at 192.0.2.58

What we observed: Problems have been reported publicly for this device's model.

What it could mean: If the device hasn't been updated, someone could use these reported problems to take control of it.

Problems have been reported publicly for this camera's model. It isn't confirmed that they affect this device. If its software is out of date, other people could get into it.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: Known issues have been reported for this model. The exact firmware version can't be confirmed without logging in, so ask the host whether it has been updated recently.

Why we think this: identification confidence Possible · priority: For information

- Known issues reported for this model: the device reported "Example Cam 2", which matches NVD product "example_cam_2_firmware" with 1 reported issue(s), for example CVE-2099-0001
- Maker: Example Camera Co.
- Network address: 192.0.2.58

Item tracker nearby · ⚠ Look at this soon

About: Tile tracker, signal -55 dBm

What we observed: An item tracker kept showing up nearby with a strong signal.

What it could mean: A tracker you don't recognise could be used to follow where you go.

An item tracker kept showing up nearby with a strong signal. Do you recognise this tracker? A tracker you don't recognise could be used to follow where you go.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: If it isn't yours, find it with the locator; a phone's built-in unknown-tracker alert gives a second opinion.

Why we think this: identification confidence Possible · priority: Look at this soon

- Its Bluetooth signal matches the format of a Tile tracker (signature from AirGuard)
- This tracker type doesn't show whether its owner is nearby
- Heard with a strong signal in 3 of 3 scans (strongest -55 dBm)
- If it belongs to you or someone you're with, this is expected

Can someone else control things here?

Not detected by the checks that ran

Can you trust this Wi-Fi?

3 things to look at

Not checked: the second-address-server check took too long and was stopped

Router offers UPnP controls for opening internet ports · ⚠ Look at this soon

About: Router or Wi-Fi access point, address xx:xx:xx:00:53:01 (ICANN, IANA Department), at 192.0.2.1

What we observed: The router advertises UPnP controls that let devices open internet ports.

What it could mean: A device here could open itself to the internet without anyone approving it, where others might reach it.

The router lets devices on this network open connections from the internet by themselves. A device could then be reached from outside without anyone noticing.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: Ask the host whether UPnP can be turned off.

Why we think this: identification confidence Likely · priority: Look at this soon

- 192.0.2.1 (Example Routers Ltd) offers internet gateway controls (UPnP), and it is this network's router

Router advertises WPS · ⚠ Look at this soon

About: Wi-Fi network "Example-Home", made by Example Routers Ltd, 5 GHz, signal -42 dBm

What we observed: The router's Wi-Fi broadcast says WPS is on.

What it could mean: Someone nearby could use WPS to get onto this Wi-Fi without the password.

Your Wi-Fi router advertises WPS, a quick way to join the network. If PIN-based WPS is enabled, the PIN could be guessed by trying many codes.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: Ask the host whether WPS can be switched off.

Why we think this: identification confidence Likely · priority: Look at this soon

- An access point called "Example-Home" (Example Routers Ltd, 5 GHz) advertises WPS
- It lists PIN entry among its setup methods

Hidden Wi-Fi network with a strong signal · ⊖ Worth knowing

About: Hidden Wi-Fi network, 2.4 GHz, signal -55 dBm

What we observed: A nearby Wi-Fi network hides its name and has a strong signal.

What it could mean: It could be a second network from a router, or a device that doesn't show its name.

A Wi-Fi network nearby doesn't show its name, and its signal is strong. Many routers hide a second network. It is worth asking what it is.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: Often ordinary, since many routers hide a second network. Shown as context, and unconfirmed.

Why we think this: identification confidence Likely · priority: Worth knowing

- A network that hides its name
- Signal -55 dBm (strong), 2.4 GHz, channel 6
- Security: WPA2
- Maker: unknown

Also found (For information. Not counted as things to look at.)

Open Wi-Fi networks nearby · ⓘ For information

What we observed: Some nearby Wi-Fi networks have no password.

What it could mean: Anything you send over these networks could be read by others, unless it is protected in another way.

There are Wi-Fi networks nearby with no password. Anything sent over them could be read by others nearby.

Explained by AI from the scan results. The risk level comes from fixed rules.

Next step: Don't use them for anything sensitive.

Why we think this: identification confidence Likely · priority: For information

- 1 open network(s) nearby; names left out

What's changed since move-in?

Save a move-in scan to see changes later.

Message to the host (draft)

> Hello,
>
> I checked the devices and Wi-Fi where I'm staying and have a few questions:

> 1. Could you tell me what the device on the Wi-Fi that looks like a camera is, where it is, what it records and who can view it?
> 2. The router advertises UPnP, which can let devices open connections from the internet by themselves. Could you check whether that can be turned off?
> 3. The Wi-Fi router advertises WPS. Could you turn it off in the router's settings?
>
> Thank you for your help.

Standard message RoomCheck never sends anything. Edit this message, then send it yourself.

Coverage and limits

17 of 18 checks ran

Check	Result
Listening for devices	Heard 3 devices
Listening for devices that announce themselves	No device announced itself
Asking every address on this network to answer	3 addresses answered
Asking devices on the network to identify themselves	1 device described itself
Sending a camera discovery request (ONVIF)	1 camera discovery reply
Devices heard in all	3 devices, each counted once however many checks heard it
Looking up who made each device	Makers found for 2 devices
Checking which services each device offers	Services checked on 3 devices
Reading device names and models	Names or models read from 2 devices
Checking how your Wi-Fi connection is encrypted	No weak encryption found
Checking whether web address lookups give the expected answers	Address lookups looked normal
Watching which devices answer for the router	One device answered for the router
Checking for a second device handing out network addresses	Not checked: the second-address-server check took too long and was stopped
Checking whether the router advertises UPnP controls	Checked
Looking up known issues for identified models	Checked
Looking at nearby Wi-Fi	Heard 6 nearby networks
Listening for nearby Bluetooth devices and trackers	Heard 4 Bluetooth devices
Checking for other networks using your Wi-Fi's name	No copies of your Wi-Fi name
Checking whether your Wi-Fi router advertises WPS	Checked

What this scan can't see

- Cameras that join a hidden or separate network as ordinary clients, or that only record to a memory card and send nothing.
- Devices on this network that stayed silent for the whole scan.
- Who owns the account a cloud-linked device is paired to.
- A device's exact firmware version. That would need logging in to it, which RoomCheck never does.
- Cameras that join the host's network as ordinary clients broadcast nothing the nearby check can hear.
- Network names, makers and tracker formats are unconfirmed: clues, not proof. The locator gives a rough area, not an exact spot.

Limitations

- It can't see cameras that join a hidden or separate network as ordinary clients, or cameras that transmit nothing (memory-card only).
- Device types, lookalike networks and tracker formats are unconfirmed: clues, not proof. Names, addresses and signal strength can be changed on purpose.
- The locator gives a rough area, not an exact spot.
- It can't identify who owns a cloud-linked account, and it can't confirm a device's exact firmware version without logging in, which it never does.
- Its weights and thresholds were tuned on a small set of devices. Results in crowded buildings will be less accurate.
- The timestamp proves when this report existed, not that its findings are correct.
- RoomCheck is a prototype, not a certified inspection, and this report is not legal advice.

About this report

Device addresses are shortened to the maker and the last three parts. Nearby networks and Bluetooth devices that weren't flagged were not kept, and the names of neighbours' open networks are left out. This report's SHA-256 hash is saved next to it in a .sha256 file, and a trusted timestamp (if one could be obtained) in a .tsr file. Use RoomCheck's "Verify a report" to check them. The timestamp shows when the report existed, not that its findings are correct.
